Environmental Protection Agency

test engine has a major mechanical failure that requires you to take it apart, you may no longer use it as an emission-data engine.

[70 FR 40516, July 13, 2005, as amended at 73 FR 37314. June 30, 2008]

$\S 1065.415$ Durability demonstration.

If the standard-setting part requires durability testing, you must accumulate service in a way that represents how you expect the engine to operate in use. You may accumulate service hours using an accelerated schedule, such as through continuous operation or by using duty cycles that are more aggressive than in-use operation, subject to any pre-approval requirements established in the applicable standard-setting part.

- (a) Maintenance. The following limits apply to the maintenance that we allow you to do on an emission-data engine:
- (1) You may perform scheduled maintenance that you recommend to operators, but only if it is consistent with the standard-setting part's restrictions
- (2) You may perform additional maintenance only as specified in §1065.410 or allowed by the standard-setting part.
- (b) Emission measurements. Perform emission tests following the provisions of the standard setting part and this part, as applicable. Perform emission tests to determine deterioration factors consistent with good engineering judgment. Evenly space any tests between the first and last test points throughout the durability period, unless we approve otherwise.

[70 FR 40516, July 13, 2005, as amended at 73 FR 37315, June 30, 2008]

Subpart F—Performing an Emission Test Over Specified Duty Cycles

§ 1065.501 Overview.

(a) Use the procedures detailed in this subpart to measure engine emissions over a specified duty cycle. Refer to subpart J of this part for field test procedures that describe how to measure emissions during in-use engine operation. This section describes how to:

- (1) Map your engine, if applicable, by recording specified speed and torque data, as measured from the engine's primary output shaft.
- (2) Transform normalized duty cycles into reference duty cycles for your engine by using an engine map.
- (3) Prepare your engine, equipment, and measurement instruments for an emission test.
- (4) Perform pre-test procedures to verify proper operation of certain equipment and analyzers.
 - (5) Record pre-test data.
- (6) Start or restart the engine and sampling systems.
- (7) Sample emissions throughout the duty cycle.
- (8) Record post-test data.
- (9) Perform post-test procedures to verify proper operation of certain equipment and analyzers.
 - (10) Weigh PM samples.
- (b) An emission test generally consists of measuring emissions and other parameters while an engine follows one or more duty cycles that are specified in the standard-setting part. There are two general types of duty cycles:
- (1) Transient cycles. Transient duty cycles are typically specified in the standard-setting part as a second-by-second sequence of speed commands and normalized torque (or power) commands. Operate an engine over a transient cycle such that the speed and torque of the engine's primary output shaft follows the target values. Proportionally sample emissions and other parameters and use the calculations in subpart G of this part to calculate emissions. Start a transient test according to the standard-setting part, as follows:
- (i) A cold-start transient cycle where you start to measure emissions just before starting an engine that has not been warmed up.
- (ii) A hot-start transient cycle where you start to measure emissions just before starting a warmed-up engine.
- (iii) A hot running transient cycle where you start to measure emissions after an engine is started, warmed up, and running.
- (2) Steady-state cycles. Steady-state duty cycles are typically specified in the standard-setting part as a list of discrete operating points (modes or
